JSON binding of IODEF  
draft-ietf-mile-jsoniodef-11

## Abstract

The Incident Object Description Exchange Format defined in RFC 7970 provides an information model and a corresponding XML data model for exchanging incident and indicator information. This draft gives implementers and operators an alternative format to exchange the same information by defining an alternative data model implementation in JSON and its encoding in CBOR.

## Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on May 21, 2020.

## 1. Introduction

The Incident Object Description Exchange Format (IODEF) [RFC7970] defines a data representation for security incident reports and indicators commonly exchanged by operational security teams. It facilitates the automated exchange of this information to enable mitigation and watch-and-warning. Section 3 of [RFC7970] defined an information model using Unified Modeling Language (UML) and a corresponding Extensible Markup Language (XML) schema data model in Section 8. This UML-based information model and XML-based data model are referred to as IODEF UML and IODEF XML, respectively in this document.

IODEF documents are structured and thus suitable for machine processing. They will streamline incident response operations. Another well-used and structured format that is suitable for machine processing is JavaScript Object Notation (JSON) [RFC8259]. To facilitate the automation of incident response operations, IODEF documents should support JSON representation and its encoding in Concise Binary Object Representation (CBOR) [RFC7049].

This document defines an alternate implementation of the IODEF UML information model by specifying a JavaScript Object Notation (JSON) data model using Concise Data Definition Language (CDDL) [RFC8610] and JSON Schema [jsonschema]. This JSON data model is referred to as IODEF JSON in this document. IODEF JSON provides all of the expressivity of IODEF XML. It gives implementers and operators an alternative format to exchange the same information.

The normative IODEF JSON data model is found in Section 5. Section 2 and Section 3 describe the data types and elements of this data model. Section 4 provides examples.

## 1.1. Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119][RFC8174] when, and only when, they appear in all capitals, as shown here.

## 2. IODEF Data Types

IODEF JSON implements the abstract data types specified in Section 2 of [RFC7970].

### 2.1. Abstract Data Type to JSON Data Type Mapping

IODEF JSON uses native and derived JSON data types. Figure 1 describes the mapping between the abstract data types in Section 2 of [RFC7970] and their corresponding implementations in IODEF JSON.

IODEF Data Type	[RFC7970] Reference	JSON Data Type
INTEGER	Section 2.1	integer, see Section 2.2.1
REAL	Section 2.2	"number" per [RFC8259]
CHARACTER	Section 2.3	"string" per [RFC8259]
STRING	Section 2.3	"string" per [RFC8259]
ML_STRING	Section 2.4	see Section 2.2.2
BYTE	Section 2.5.1	"string" per [RFC8259]
BYTE[]	Section 2.5.1	"string" per [RFC8259]
HEXBIN	Section 2.5.2	"string" per [RFC8259]
HEXBIN[]	Section 2.5.2	"string" per [RFC8259]
ENUM	Section 2.6	see Section 2.2.3
DATETIME	Section 2.7	"string" per [RFC8259]
TIMEZONE	Section 2.8	"string" per [RFC8259]
PORTLIST	Section 2.9	"string" per [RFC8259]
POSTAL	Section 2.10	ML_STRING, Section 2.2.2
PHONE	Section 2.11	"string" per [RFC8259]
EMAIL	Section 2.12	"string" per [RFC8259]
URL	Section 2.13	"string" per [RFC8259]
ID	Section 2.14	"string" per [RFC8259]
IDREF	Section 2.14	"string" per [RFC8259]
SOFTWARE	Section 2.15	see Section 2.2.4
STRUCTUREDINFO	[RFC 7203]	see Section 2.2.5
EXTENSION	Section 2.16	see Section 2.2.6

Figure 1: JSON Data Types

IODEF Data Type	CBOR Data Type	CDDL prelude [RFC8610]
INTEGER	0, 1, 6 tag 2, 6 tag 3	integer
REAL	7 bits 26	float32

EXTENSION	5	Maps/Structs (Section 3.5.1)

Figure 2: CBOR Data Types

## 2.2. Complex JSON Types

### 2.2.1. Integer

An integer is a subset of "number" type of JSON, which represents signed digits encoded in Base 10. The definition of this integer is "[ minus ] int" in [RFC8259] Section 6 manner.

### 2.2.2. Multilingual Strings

A string that needs to be represented in a human-readable language different from the default encoding of the document is represented in the information model by the ML\_STRING data type. This data type is implemented as either an object with "value", "lang", and "translation-id" elements or a text string as defined in Section 5. Examples are shown below.

```
"MLStringType": {
  "value": "free-form text",                                # STRING
  "lang": "en",                                            # ENUM
  "translation-id": "jp2en0023"                            # STRING
}
```

Note that some pieces of supplementary information are provided followed by "#" in figures throughout this document, but these are not a valid syntax in JSON.

#### 2.2.3. Enum

Enum is an ordered list of acceptable string values. Each value has a representative keyword. Within the data model, the enumerated type keywords are used as attribute values.

#### 2.2.4. Software and Software Reference

A particular version of software is represented in the information model by the SOFTWARE data type. This software can be described by using a reference, a Uniform Resource Locator (URL) [RFC3986], or with free-form text. The SOFTWARE data type is implemented as an object with "SoftwareReference", "URL", and "Description" elements as defined in Section 5. Examples are shown below.

```
"SoftwareType": {
  "SoftwareReference": {...},                               # SoftwareReference
  "Description": ["MS Windows"]                           # STRING
}
```

SoftwareReference class is a reference to a particular version of software. Examples are shown below.

```
"SoftwareReference": {
  "value": "cpe:/a:google:chrome:59.0.3071.115",          # STRING
  "spec-name": "cpe",                                     # ENUM
  "dtype": "string"                                      # ENUM
}
```

#### 2.2.5. Structured Information

Information provided in a form of structured string, such as ID, or structured information, such as XML documents, is represented in the information model by the STRUCTUREDINFO data type. Note that this type was originally specified in [RFC7203]. The STRUCTUREDINFO data type is implemented as an object with "SpecID", "ext-SpecID", "ContentID", "RawData", and "Reference" elements. An example for embedding a structured ID is shown below.

```
"StructuredInfo": {
  "SpecID": "urn:ietf:params:xml:ns:mile:cwe:3.3",           # ENUM
  "ContentID": "CWE-89"                                       # STRING
}
```

When embedding the raw data, base64 encoding defined in Section 4 of [RFC4648] SHOULD be used for encoding the data, as shown below.

```
"StructuredInfo": {
  "SpecID": "urn:ietf:params:xml:ns:mile:mmdef:1.2",          # ENUM
  "RawData": "<<<strings encoded with base64>>>"        # BYTE
}
```

## 2.2.6. EXTENSION

Information not otherwise represented in the IODEF can be added using the EXTENSION data type. This data type is a generic extension mechanism. The EXTENSION data type is implemented as an ExtensionType object with "value", "name", "dtype", "ext-dtype", "meaning", "formatid", "restriction", "ext-restriction", and "observable-id" elements. An example for embedding a structured ID is shown below.

```
"ExtensionType": {
  "value": "xxxxxxxx",                                         # STRING
  "name": "Syslog",                                           # STRING
  "dtype": "string",                                         # ENUM
  "meaning": "Syslog from the security appliance X"          # STRING
}
```

## 3. IODEF JSON Data Model

### 3.1. Classes and Elements

The following table shows the list of IODEF Classes, their elements, and the corresponding section in [RFC7970]. Note that the complete JSON schema is defined in Section 5 using CDDL.

IODEF Class	Class Elements and Attribute	Corresponding Section in [RFC7970]
IODEF-Document	version lang? format-id? private-enum-name? private-enum-id?	3.1

Figure 3: IODEF Classes

### 3.2. Mapping between JSON and XML IODEF

- o Attributes and elements of each class in XML IODEF document are both presented as JSON attributes in JSON IODEF document, and the order of their appearances is ignored.
- o Flow class is deleted, and classes with its instances now directly have instances of EventData class that used to belong to the Flow class.
- o ApplicationHeader class is deleted, and classes with its instances now directly have instances of ApplicationHeaderField class that used to belong to the ApplicationHeader class.
- o SignatureData class is deleted, and classes with its instances now directly have instance of Signature class that used to belong to the SignatureData class.

- o IndicatorData class is deleted, and classes with its instances now directly have the instances of Indicator class that used to belong to the IndicatorData class.
- o ObservableReference class is deleted, and classes with its instances now directly have uid-ref as an element.
- o Record class is deleted, and classes with its instances now directly have the instances of RecordData class that used to belong to the Record class.
- o The MLStringType were modified to support simple string by allowing the type to have not only a predefined object type but also text type, in order to allow simple descriptions of elements of the type.
- o The elements of ML\_STRING type in XML IODEF document are presented as either STRING type or ML\_STRING type in JSON IODEF document.
- o Data models of the extension classes defined by [RFC7203] and referenced by [RFC7970] are represented by StructuredInfo class defined in this document.
- o Signature, X509Data, and RawData are encoded with base64 and are represented as string (BYTE type) in JSON IODEF documents.
- o EmailBody represents an whole message body including MIME structure in the same manner defined in [RFC7970]. In case of an email composed of MIME multipart, the EmailBody contains multiple body parts separated by boundary strings.
- o The "ipv6-net-mask" type attribute of BulkObservable class remains available for the backward compatibility purpose, but the use of this attribute is not recommended because IPV6 does not use netmask any more.

## 4. Examples

This section provides examples of IODEF documents. These examples do not represent the full capabilities of the data model or the only way to encode particular information.

### 4.1. Minimal Example

A document containing only the mandatory elements and attributes is shown below in JSON and CBOR, respectively.

```
{
  "version": "2.0",
  "lang": "en",
  "Incident": [
    {
      "purpose": "reporting",
      "restriction": "private",
      "IncidentID": {
        "id": "492382",
        "name": "csirt.example.com"
      },
      "GenerationTime": "2015-07-18T09:00:00-05:00",
      "Contact": [
        {
          "type": "organization",
          "role": "creator",
          "Email": [ {"EmailTo": "contact@csirt.example.com"} ]
        }
      ]
    }
  ]
}
```

Figure 8: Data Model in CDDL

## 6. IANA Considerations

This document does not require any IANA actions.

## 7. Security Considerations

This document does not provide any further security considerations than the one described in [RFC7970].

## 8. Acknowledgments

We would like to thank Henk Birkholz, Carsten Bormann, Yasuaki Morita, and Takahiko Nagata for their insightful comments on CDDL.

## 9. References

## Appendix A. Data Types used in this document

The CDDL prelude used in this document is mapped to JSON as shown in the table below.

CDDL Prelude	Use of JSON	Instance	Validation
bytes	n/a	string	tool available
text	string	string	unnecessary
tdate	n/a	string	7.3.1 date-time
integer	n/a	number	integer
eb64legacy	n/a	string	tool available
uri	n/a	string	7.3.6 uri
float32	float32	number	unnecessary
