## Definitions of Managed Objects for the Optical Interface Type

### Status of this Memo

This document specifies an Internet standards track protocol for the Internet community, and requests discussion and suggestions for improvements. Please refer to the current edition of the "Internet Official Protocol Standards" (STD 1) for the standardization state and status of this protocol. Distribution of this memo is unlimited.

### Copyright Notice

### Abstract

This memo defines a portion of the Management Information Base (MIB) for use with Simple Network Management Protocol (SNMP) in TCP/IP-based internets. In particular, it defines objects for managing Optical Interfaces associated with WavelengthDivision Multiplexing systems or characterized by the Optical Transport Network (OTN) in accordance with the OTN architecture defined in ITU-T Recommendation G.872.

The MIB module defined in this memo can be used for performance monitoring and/or configuration of such optical interface.

## 1. The Internet-Standard Management Framework

For a detailed overview of the documents that describe the current Internet-Standard Management Framework, please refer to section 7 of RFC 3410 [RFC3410].

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. MIB objects are generally accessed through the Simple Network Management Protocol (SNMP). Objects in the MIB are defined using the mechanisms defined in the Structure of Management Information (SMI). This memo specifies a MIB module that is compliant to the SMIv2, which is described in STD 58, RFC 2578 [RFC2578], STD 58, RFC 2579 [RFC2579] and STD 58, RFC 2580 [RFC2580].

## 2. Overview

In this document, the term OTN (Optical Transport Network) system is used to describe devices that are compliant with the requirements specified in the ITU-T Recommendations G.872 [ITU-T G.872], G.709 [ITU-T G.709], G.798 [ITU-T G.798], G.874 [ITU-T G.874], and G.874.1 [ITU-T G.874.1].

The optical objects will be managed using the MIB II ifTable and ifStackTable. Additional tables will also be supported to monitor layer specific status and provide performance monitoring data. In the tables, some entries are required for OTN systems only. A Configuration (Config) table, Current Performance Monitoring (PM) table, and Interval PM table will be maintained for the OTSn, OMSn, OChGroup, and OCh layers on a source and sink trail termination basis. These tables will be linked to the ifTable by using the ifIndex that is associated with that layer.

These objects are used when the particular media being used to realize an interface is an Optical Transport interface. At present, this applies to these values of the ifType variable in the Internet-standard MIB:

opticalChannel (195), opticalChannelGroup (219), opticalTransport (196)

The definitions contained herein are based on the OTN specifications in ITU-T G.872[ITU-T G.872], G.709 [ITU-T G.709], G.798[ITU-T G.798], G.874[ITU-T G.874], and G.874.1 [ITU-T G.874.1].

### 2.1. Use of the ifTable

This section specifies how the MIB II interfaces group, as defined in RFC 2863 [RFC2863], is used for optical interfaces. Only the ifGeneralInformationGroup will be supported for the ifTable and the ifStackTable to maintain the relationship between the various layers. The OTN layers are managed in the ifTable using IfEntries that correlate to the layers depicted in Figure 1.

For example, a DWDM device with an Optical Network Node Interface (ONNI) will have an Optical Transmission Section (OTS) physical layer, an Optical Multiplex Section (OMS) layer (transports multiple optical channels), and an Optical Channel (OCh) layer. There is a one to one relationship between the OMS and OTS layers. The OMS layer has fixed connectivity via the OTS and thus no connectivity flexibility at the OMS layer is supported.

A device with an ONNI that does not multiplex would consist of the OTS and OCh layers supporting a single channel.

MIB-II (RFC 1213) [RFC1213], as amended and extended by RFC 3418 [RFC3418], RFC 2863 [RFC2863], and RFC 2864 [RFC2864], accommodates these cases through appropriate use of the system and interfaces groups. The system group names and describes the type of managed resource. The interfaces group defines which OTN layers exist and how these layers are configured and multiplexed. This is achieved by proper representation of OTN Layers as IfEntries as defined in RFC 2863 [RFC2863], as follows.

In the following figures, opticalChannel and opticalTransport are abbreviated as och and otn respectively.

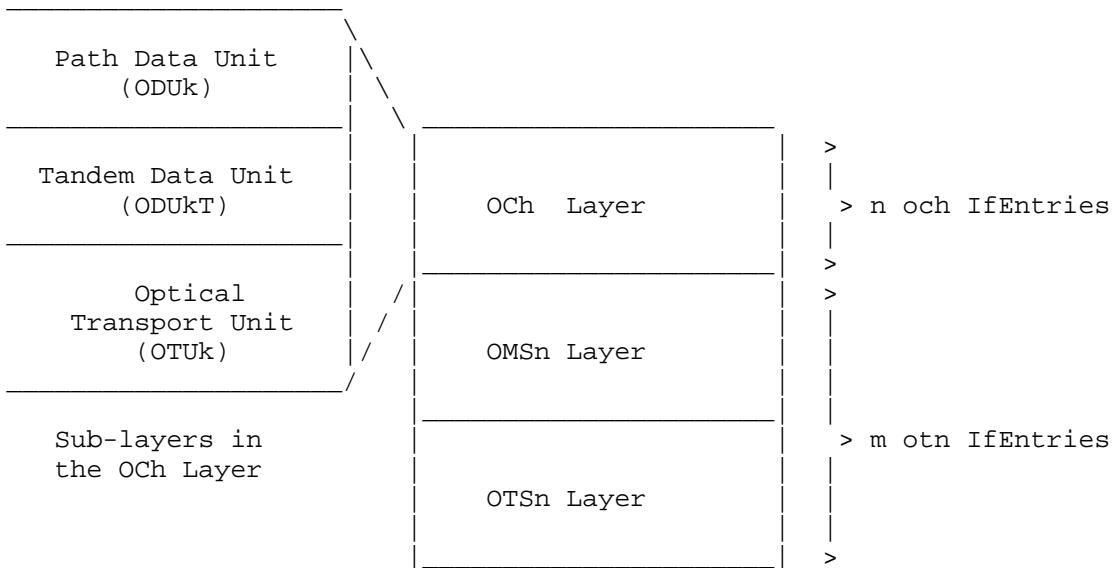

Figure 1: OTN Layers

Since the OMSn and OTSn layers have a one to one relationship, only one otn IfEntry is required to support these two layers. Therefore, each opticalChannel IfEntry may be mapped to m opticalTransport IfEntries, where m is greater than or equal to 1. Conversely, each opticalTransport entry may be mapped to n opticalChannel IfEntries, where n is greater than or equal to 1.

There are implementations that have banded amplifiers that operate on a group of optical channels separately (e.g., C and L band channels) before finally muxing them together and transporting them over a

physical layer. For such DWDM system implementations, it is important to have the ability to model each of the groups (or bands) with an ifIndex and measure the pre-OTN PM parameters for each band separately.

The OTN layering, as described in Figure 1, can be extended to accomodate such implementations by introducing another layer called the OChGroup Layer.

As an example, Figure 2 depicts the OTN layering of a DWDM system with 80 C-band and 80 L-band channels combined into their respective channel band groups before being muxed into the OMS and transported over the OTS.

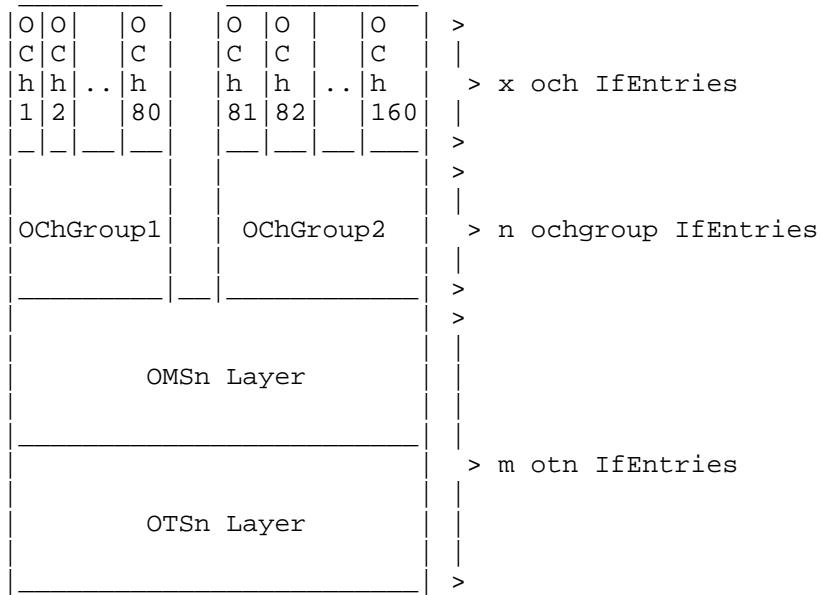

Figure 2: OTN Layers for a Banded Configuration

If an implementation does not wish to model the banded configuration, the OChGroup layer is absent and the OTN layering model degenerates to the description in Figure 1. In other words, when there is an amplifier that covers the whole band, the optIfOMSn objects should be used, rather than using the optIfOChGroup objects with a degenerate group that covers all channels.

The design of the Optical Interface MIB provides the option to model an interface either as a single bidirectional object containing both sink and source functions or as a pair of unidirectional objects, one containing sink functions and the other containing source functions.

If the sink and source for a given protocol layer are to be modelled as separate objects, then there need to be two ifTable entries, one that corresponds to the sink and one that corresponds to the source, where the directionality information is provided in the configuration tables for that layer via the xxxDirectionality objects. The agent is expected to maintain consistent directionality values between ifStackTable layers (e.g., a sink must not be stacked in a 1:1 manner on top of a source, or vice-versa), and all protocol layers that are represented by a given ifTable entry are expected to have the same directionality (i.e., instances of optIfOTSnDirectionality and optIfOMSnDirectionality that correspond to a given ifIndex value must have the same value, and instances of optIfOChDirectionality, optIfOTUkDirectionality, and optIfODUkDirectionality that correspond to a given ifIndex value must have the same value).

When separate ifTable entries are used for the source and sink functions of a given physical interface, association between the two uni-directional ifTable entries (one for the source function and the other for the sink functions) should be provided. It is recommended that identical ifName values are used for the two ifTable entries to indicate such association. An implementation shall explicitly state what mechanism is used to indicate the association, if ifName is not used.

**Example 1: Management of unterminated opticalChannel (och) using passive optics**

An OTN device connected with two adjacent nodes in a single fiber ring that supports 10 wavelengths per fiber would have 2 opticalTransport IfEntries and 20 opticalChannel IfEntries, as depicted in Figure 3. Thus 10 opticalChannel IfEntries are stacked above the first opticalTransport IfEntry, and the other 10 opticalChannel IfEntries are stacked above the second opticalTransport IfEntry. Note that the optical channels in this example are un-terminated, and thus no OTUk objects will be instantiated for these optical channels. The opticalChannel IfEntries of one otn may be dropped/added from/to the OTN device or cross-connected with the opticalChannel IfEntries of the other otn. Cross-connection from a member of the first 10 opticalChannel IfEntries to a member of the second 10 opticalChannel IfEntries could be modelled by using a cross-connect object, which is not yet defined in this version of the MIB.

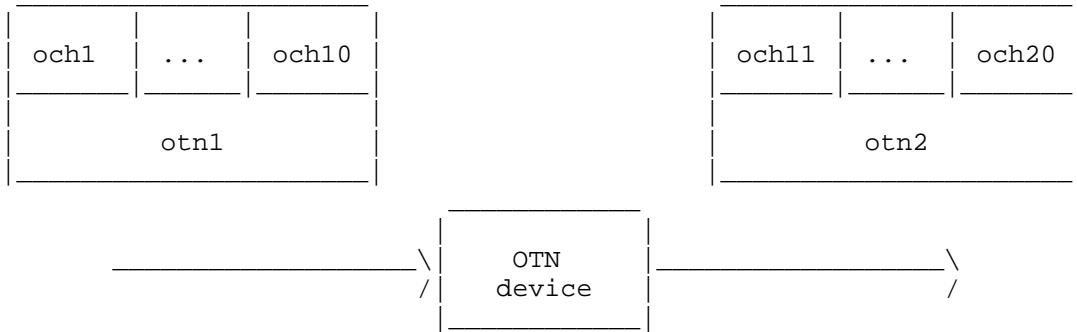

Figure 3: Interface stacks when channels are unterminated

## Example 2: Management of terminated opticalChannel (och) interfaces

An OTN device connected with two adjacent nodes in a single fiber ring that supports 10 wavelengths per fiber would have 2 opticalTransport IfEntries and 20 opticalChannel IfEntries, as depicted in Figure 4. Thus 10 opticalChannel IfEntries are stacked above the first opticalTransport IfEntry, and the other 10 opticalChannel IfEntries are stacked above the second opticalTransport IfEntry. As the optical channels in this example are terminated, OTUk objects and possibly ODUk objects will be instantiated for the terminated opticalChannel IfEntries.

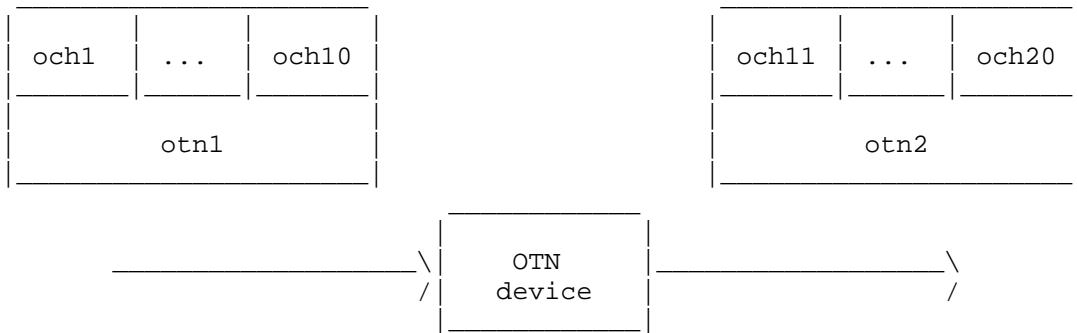

Figure 4: Interface stacks when channels are terminated

Note that the two examples described above depict the interface stacks when the banded configuration is not modeled.

The exact configuration and multiplexing of the layers is maintained in the ifStackTable (RFC 2863) [RFC2863] and in the ifInvStackTable (RFC 2864) [RFC2864]; see section 2.5 for details.

## 2.2. Use of ifTable for OTN OTS/OMS Layer

Only the ifGeneralInformationGroup needs to be supported.

ifTable Object	Use for combined OTN OTS/OMS Layer
=====	=====
ifIndex	The interface index.
ifDescr	Optical Transport Network (OTN) Optical Transmission Section (OTS)/Optical Multiplex Section (OMS)
ifType	opticalTransport (196)
ifSpeed	Actual bandwidth of the interface in bits per second. If the bandwidth of the interface is greater than the maximum value of 4,294,967,295, then the maximum value is reported and ifHighSpeed must be used to report the interface's speed.
ifPhysAddress	An octet string with zero length. (There is no specific address associated with the interface.)
ifAdminStatus	The desired administrative status of the interface. Supports read-only access.
ifOperStatus	The operational status of the interface. The value lowerLayerDown(7) is not used, since there is no lower layer interface. This object is set to notPresent(6) if a component is missing, otherwise it is set to down(2) if either of the objects optIfOTSnCurrentStatus or optIfOMSnCurrentStatus indicates that any defect is present.
ifLastChange	The value of sysUpTime at the last change in ifOperStatus.

**ifName** Enterprise-specific convention (e.g., TL-1 AID) to identify the physical or data entity associated with this interface or an OCTET STRING of zero length. The enterprise-specific convention is intended to provide the means to reference one or more enterprise-specific tables.

**ifLinkUpDownTrapEnable** Default value is enabled(1). Supports read-only access.

**ifHighSpeed** Actual bandwidth of the interface in Mega-bits per second. A value of n represents a range of 'n-0.5' to 'n+0.499999'.

**ifConnectorPresent** Set to true(1).

**ifAlias** The (non-volatile) alias name for this interface as assigned by the network manager.

### 2.3. Use of ifTable for OTN OChGroup Layer

Only the ifGeneralInformationGroup needs to be supported.

**ifTable Object** Use for OTN OChGroup Layer  
=====

<b>ifIndex</b>	The interface index.
<b>ifDescr</b>	Optical Transport Network (OTN) Optical Channel Group (OChGroup)
<b>ifType</b>	opticalChannelGroup(219)
<b>ifSpeed</b>	Current bandwidth of the interface in bits per second. If the bandwidth of the interface is greater than the maximum value of 4,294,967,295, then the maximum value is reported and ifHighSpeed must be used to report the interface's speed.
<b>ifPhysAddress</b>	A string that specifies the range of wavelengths in the format of w1-w2, where w1 and w2 are the lower and upper end of the wavelength range, both in ASCII decimal digits expressed in nanometers (e.g., 1350-1650)

<b>ifAdminStatus</b>	The desired administrative status of the interface. Supports read-only access.
<b>ifOperStatus</b>	The operational status of the interface. This object is set to lowerLayerDown(7) if the ifOperStatus of its otn interface is down(2). Otherwise, it is set to down(2) if the amplifier for this band is unable to carry traffic.
<b>ifLastChange</b>	The value of sysUpTime at the last change in ifOperStatus.
<b>ifName</b>	Enterprise-specific convention (e.g., TL-1 AID) to identify the physical or data entity associated with this interface or an OCTET STRING of zero length. The enterprise-specific convention is intended to provide the means to reference one or more enterprise-specific tables.
<b>ifLinkUpDownTrapEnable</b>	Default value is disabled(2). Supports read-only access.
<b>ifHighSpeed</b>	Current bandwidth of the interface in Mega-bits per second. A value of n represents a range of 'n-0.5' to 'n+0.499999'.
<b>ifConnectorPresent</b>	Set to false(2).
<b>ifAlias</b>	The (non-volatile) alias name for this interface as assigned by the network manager.

#### 2.4. Use of ifTable for OTN OCh Layer

Only the ifGeneralInformationGroup needs to be supported.

<b>ifTable Object</b>	Use for OTN OCh Layer
<hr/>	
<b>ifIndex</b>	The interface index.
<b>ifDescr</b>	Optical Transport Network (OTN) Optical Channel (OCh)
<b>ifType</b>	opticalChannel(195)

<b>ifSpeed</b>	Current bandwidth of the interface in bits per second. If the bandwidth of the interface is greater than the maximum value of 4,294,967,295, then the maximum value is reported and ifHighSpeed must be used to report the interface's speed.
<b>ifPhysAddress</b>	A string of ASCII decimal digits containing the wavelength of the optical channel, expressed in nanometers (e.g., 1550).
<b>ifAdminStatus</b>	The desired administrative status of the interface. Supports read-only access.
<b>ifOperStatus</b>	The operational status of the interface. This object is set to lowerLayerDown(7) if the ifOperStatus of its otn interface or of its OChGroup interface is down(2). Otherwise, it is set to down(2) if one or more of the objects optIfoOChCurrentStatus, optIfOTUkCurrentStatus, optIfODUkTCurrentStatus, and optIfODUkTtpCurrentStatus indicates that any defect is present.
<b>ifLastChange</b>	The value of sysUpTime at the last change in ifOperStatus.
<b>ifName</b>	Enterprise-specific convention (e.g., TL-1 AID) to identify the physical or data entity associated with this interface or an OCTET STRING of zero length. The enterprise-specific convention is intended to provide the means to reference one or more enterprise-specific tables.
<b>ifLinkUpDownTrapEnable</b>	Default value is disabled(2). Supports read-only access.
<b>ifHighSpeed</b>	Current bandwidth of the interface in Mega-bits per second. A value of n represents a range of 'n-0.5' to 'n+0.49999'.
<b>ifConnectorPresent</b>	Set to false(2).
<b>ifAlias</b>	The (non-volatile) alias name for this interface as assigned by the network manager.

## 2.5. Use of ifStackTable

Use of the ifStackTable and ifInvStackTable to associate the opticalTransport and opticalChannel interface entries is best illustrated by the example shown in Figure 5. The example assumes an otn interface with ifIndex i that carries two multiplexed och interfaces with ifIndex values of j and k, respectively. The example shows that j and k are stacked above (i.e., multiplexed into) i. Furthermore, it shows that there is no layer lower than i and no layer higher than j and/or k.

HigherLayer	LowerLayer
0	j
0	k
j	i
k	i
i	0

Figure 5: Use of ifStackTable for an OTN port

Figure 6 illustrates an example for a banded configuration. The example assumes an otn interface with ifIndex i that carries two multiplexed och groups with ifIndex values u and v. An och group with ifIndex value u combines two och interfaces with ifIndex values of a and b. An och group with ifIndex value v combines two och interfaces with ifIndex values of c and d. The example show that a and b are stacked above (i.e., multiplexed into) u. Likewise, c and d are stacked above v. u and v are multiplexed into i. Furthermore, it shows that there is no layer lower than i and no layer higher than a, b, c, and/or d. It also shows that u has a and b as its higher layers, and v has c and d as its higher layers.

HigherLayer	LowerLayer
0	a
0	b
0	c
0	d
a	u
b	u
c	v
d	v
u	i
v	i
i	0

Figure 6: Use of ifStackTable for an OTN port for a banded configuration

For the inverse stack table, it provides the same information as the interface stack table, with the order of the Higher and Lower layer interfaces reversed.

## 2.6. Optical Network Terminology

The terminology used in this document to describe the layers of an optical network and the error conditions and performance monitoring parameters on an optical circuit as monitored by an optical system is listed below. These terms are defined in ITU-T Recommendations G.872 [ITU-T G.872], G.709 [ITU-T G.709], G.798 [ITU-T G.798], G.874 [ITU-T G.874], G.874.1 [ITU-T G.874.1], and G.806 [ITU-T G.806]. Brief definitions of some terms are also included here to facilitate the readability of this document.

Degraded Threshold (DEGTHR) - G.806

A threshold level for declaring a performance monitoring (PM) Second (a time period of one second) to be bad. A PM Second is declared bad if the percentage of detected errored blocks in that second or the number of errored blocks in that Second is greater than or equal to DEGTHR.

DEGM - G.806

A threshold level for declaring a Degraded Signal defect (dDEG). A dDEG shall be declared if DEGM consecutive bad PM Seconds are detected.

Expected Destination Access Point Identifier (ExDAPI) - G.798

The Expected Destination Access Point Identifier (ExDAPI), provisioned by the managing system, to be compared with the TTI accepted at the overhead position of the sink for the purpose of checking the integrity of connectivity.

Expected Source Access Point Identifier (ExSAPI) - G.798

The Expected Source Access Point Identifier (ExSAPI), provisioned by the managing system, to be compared with the TTI accepted at the overhead position of the sink for the purpose of checking the integrity of connectivity.

Inter-Domain Interface (IrDI) - G.872

A physical interface that represents the boundary between two administrative domains.

G.709 defines the requirements for the IrDI at the Network Node Interface (NNI).

Intra-Domain Interface (IaDI) - G.872

A physical interface within an administrative domain.

**Optical Channel Layer Network (OCh) - G.872**

This layer network provides end-to-end networking of optical channels for transparently conveying client information of varying format (e.g., SDH STM-N, PDH 565 Mbit/s, cell based ATM, etc.).

**Optical Channel Data Unit Path Layer Network (ODUk) - G.709/Y.1331**

This layer network provides functionality for the transport of information structure consisting of the information payload (OPUk) and the related overhead for management of an optical channel.

**Optical Channel Data Unit Tandem Connection Sub-Layer Network (ODUkT)  
- G.709/Y.1331**

This layer network is a sub-layer of the optical data unit layer, which provides the capability for tandem connection monitoring. One to six nested levels of monitoring are defined for OTN.

**Optical Channel Payload Unit (OPUk) - G.709/Y.1331**

The OPUk is the information structure used to adapt client information for transport over an optical channel. OPUk capacities for k=1, k=2, k=3 are defined in ITU-T. The index "k" is used to represent different versions of OPUk, ODUk and OTUk. k=1 represents an approximate bit rate of 2.5 Gbit/s, k=2 represents an approximate bit rate of 10 Gbit/s, and k=3 represents an approximate bit rate of 40 Gbit/s.

**Optical Multiplex Section Layer Network (OMS) - G.872**

This layer network provides functionality for networking of a multi-wavelength optical signal. Note that a "multi-wavelength" signal includes the case of just one optical channel.

**Optical Transport Module (OTM-n[r].m) - G.872**

The OTM is the information structure that is transported across an ONNI. The index n and m define the number of supported wavelengths and bit rates at the interface.

Two OTM structures are defined: OTM with full functionality (OTM-n.m) and OTM with reduced functionality (OTM-0.m & OTM-nr.m).

The OTM-n.m consists of up to n multiplexed optical channels and an OTM overhead signal to support the non-associated overhead. The OTM-0 consists of a single optical channel

without a specific color assigned. The OTM-nr.m consists of up to n multiplexed optical channels. Non associated overhead is not supported.

**Optical Transport Network (OTN) - G.872**

A transport network bounded by optical channel access points. The optical transport network layered structure is comprised of the optical channel, optical multiplex section and optical transmission section layer networks.

According to G.872, an OTN-compliant interface is an interface of the optical transport network based on the architecture defined in G.872, while an OTN-non-compliant interface is an interface that does not comply with the interface recommendations that will be defined for the optical transport network based on the architecture defined in G.872.

**Optical Transmission Section Layer Network (OTS) - G.872**

This layer network provides functionality for transmission of optical signals on optical media of various types.

**Optical Channel Transport Unit Section Layer Network (OTUk) - G.709**

The OTUk is the layer network that provides for the transport of an ODUk over one or more optical channel link connections. It consists of the optical channel data unit and OTUk related overhead (FEC and overhead for management of an optical channel link connection). It is characterized by its frame structure, bit rate, and bandwidth.

**Payload Type Mismatch (PLM)**

The detection of a mismatch of payload type is based on a comparison between the expected Payload Type signal, provisioned via the management interface, and the received Payload Type signal.

**Trail Trace Identifier Transmitted (TxTI) - G.798**

The Trail Trace Identifier (TTI) information, provisioned by the managing system, to be placed in the TTI overhead position of the source of a trail for transmission.

**Trail Trace Identifier Accepted (AcTI) - G.798**

The Trail Trace Identifier (TTI) information accepted from the TTI overhead position at the sink of a trail.

**Trail Trace Identifier Accepted Status (AcTISStatus) - G.798**

The Status of the Trail Trace Identifier (TTI) accepted from the TTI overhead position at the sink of a trail.

**Trace Identifier Mismatch (TIM) - G.798**

The detection of TIM is based on a comparison between the expected Trial Trace Identifier (TTI), configured via the management interface, and the received TTI.

**Trace Identifier Mismatch Consequent Action Enabled (TimActEnabled) - G.798**

The Consequent Action function of TIM is disabled.

**Trace Identifier Mismatch Detection Mode (TimDetMode) - G.798**

The mode of detecting Trace Identifier Mismatch (TIM). Possible modes are:

- (1) off - no checking,
- (2) SAPI - checking the SAPI only,
- (3) DAPI - checking the DAPI only, and
- (4) Both - checking both the SAPI and DAPI.

#### 2.6.1. Defect Conditions

The following Defect conditions are defined in G.798 (as fault cause) for OTN monitoring.

ais	Alarm Indication Signal (AIS)
bdi	Backward Defect Indication (BDI)
bdiO	Backward Defect Indication - Overhead (BDI-O)
bdiP	Backward Defect Indication - Payload (BDI-P)
deg	Degraded (DEG)
lck	Locked (LCK)
lof	Loss of Frame (LOF)
lom	Loss of Multi Frame
los	Loss of Signal (LOS)
losO	Loss of Signal - Overhead (LOS-O)
losP	Loss of Signal - Payload (LOS-P)
oci	Open Connection Indication (OCI)
plm	Payload Mismatch (PLM)
ssf	Server Signal Failure (SSF)
ssfO	Server Signal Failure - Overhead (SSF-O)
ssfP	Server Signal Failure - Payload (SSF-P)
tim	Trace Identifier Mismatch (TIM)

The relationship of these conditions within a network layer and between layers are described in G.798 [ITU-T G.798].

## 2.6.2. Performance Parameters

To facilitate identification of equipment and facilities that may require maintenance, it is necessary to monitor parameters such as optical power at each layer. The measurements are taken periodically, and a snapshot of the current value is also made available. More specifically, performance parameters at each layer are maintained for the current 15-minute interval, the current 24-hour interval, N previous 15-minute intervals where  $4 \leq N \leq 96$ , and one previous 24-hour interval.

Note that some of the previous interval data will be unavailable if the agent has restarted within the last 24 hours.

There is no requirement for an agent to ensure a fixed relationship between the start of a 15-minute or 24-hour interval and any wall clock; however, some agents may align the 15-minute intervals with quarter hours and may align the 24-hour intervals with a particular hour of the day (e.g., 00:00 UTC).

Note that some DWDM systems may also monitor the laser temperature of the equipment in addition to monitoring the optical power. However, industry opinions vary widely with respect to laser temperature monitoring, in particular regarding the benefit of the monitoring and which temperatures are to be monitored (i.e., all or only some of the pump lasers). Similarly, there are varying opinions regarding mid-stage power monitoring. Since no consensus was reached, it was decided that the laser temperature monitoring and mid-stage monitoring would not be standardized in the MIB. If an implementation would like to monitor these parameters, one could use a proprietary MIB or the ENTITY-SENSOR-MIB [RFC3433] to capture this information.

The sink-side monitoring points for the various layers are shown in Figure 7 below.

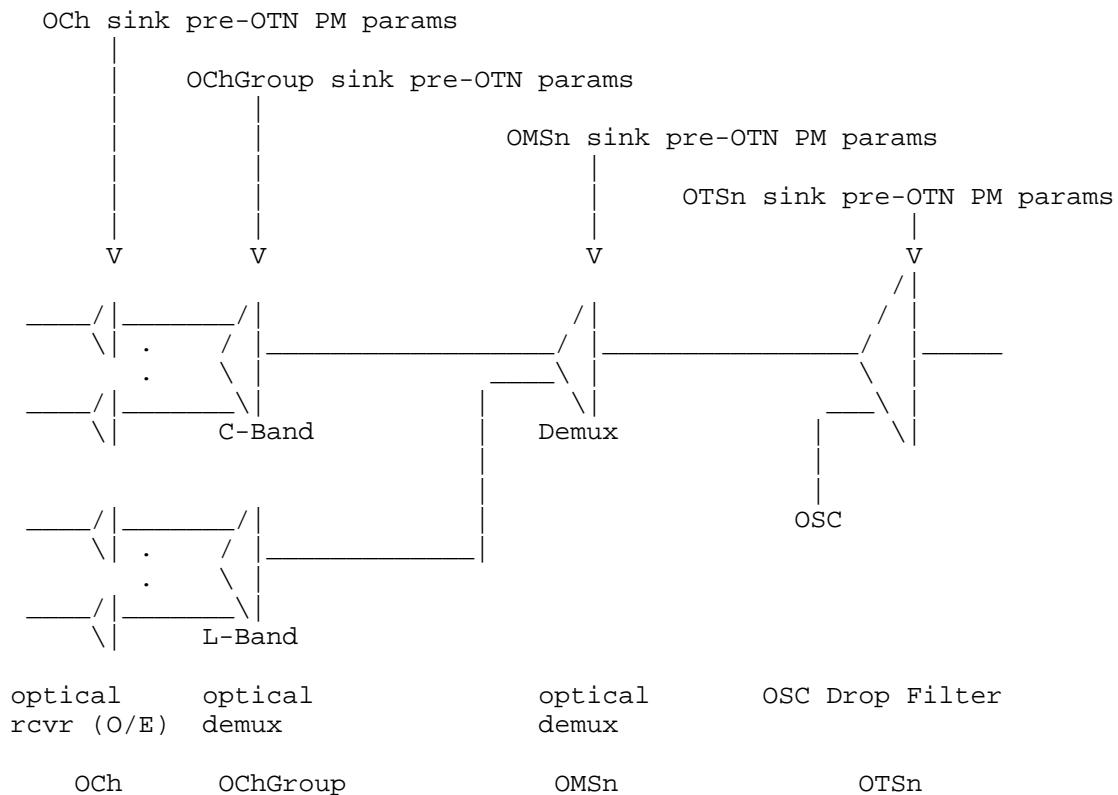

Figure 7: Sink-side pre-OTN monitoring points

The source-side monitoring points for the various layers are shown in Figure 8 below.

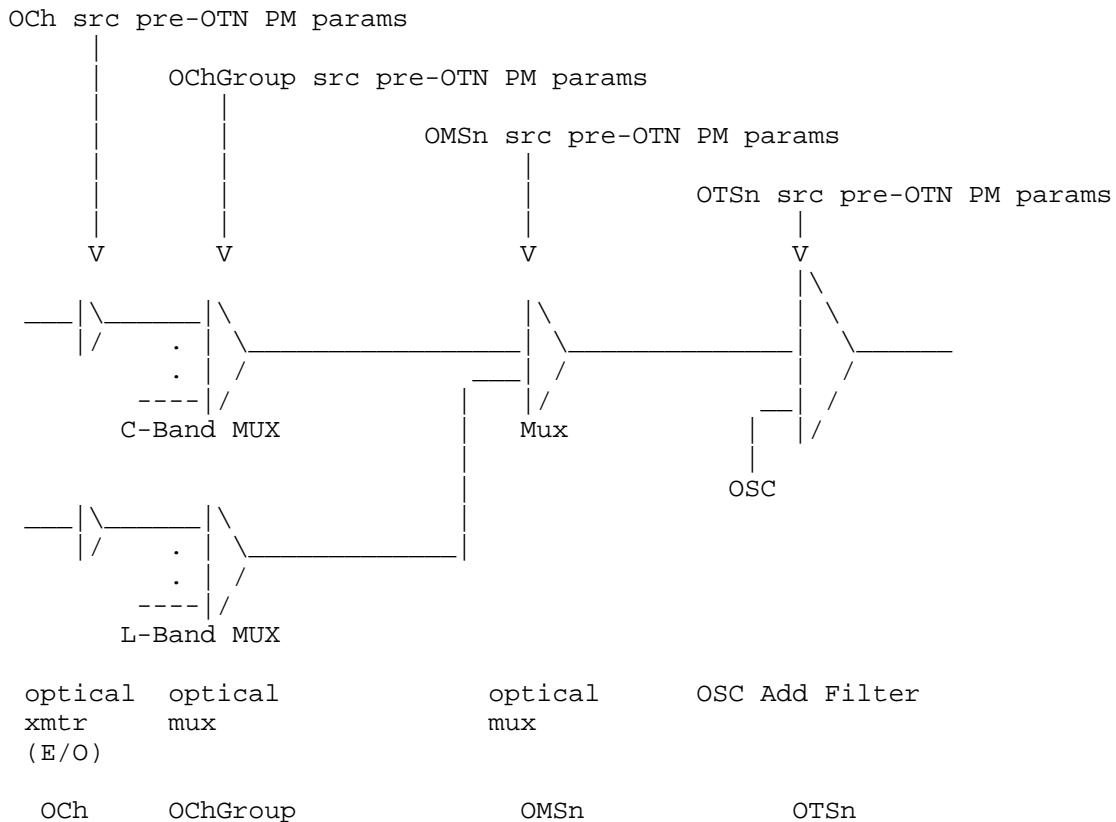

Figure 8: Source-side pre-OTN monitoring points

Note that optical performance parameters are of type Integer32, rather than Counter32 or Gauge32, because it is possible for these objects to increase or decrease and to assume negative or positive values.

## 2.7. Tandem Connection Monitoring (TCM)

An ODUk termination can be provisioned to support (0..6) TCM levels. Each TCM field contains the following subfields:

- Trail Trace Identifier (TTI)
- Bit Interleaved Parity 8 (BIP8)
- Backward Defect Indication (BDI)
- Backward Error Indication (BEI)
- Status bits indicating the presence of TCM overhead, Incoming AlignmentError, or a maintenance signal (STAT).

The insertion of these subfields is controlled by:

- optIfODUkTSourceMode or otnODUkTsinkMode

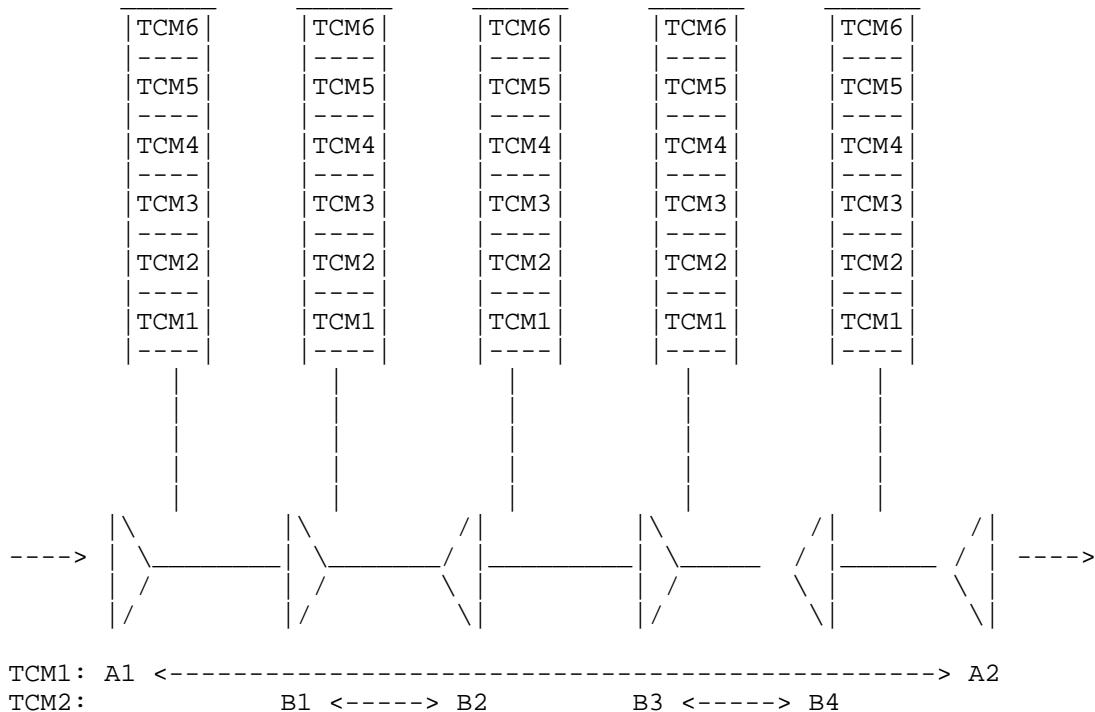

The detection and corresponding action of these subfields are controlled by:

- optIfODUkTTimDetMode
- optIfODUkTTimActEnabled

The TCM connection is used for monitoring the quality of an end to end connection or any segment, as illustrated in the example:

TCM1 used for the end-to-end connection from A1 to A2.  
TCM2 used for segment B1-B2, then used again for segment B3-B4.  
TCM3-TCM6 these bytes are not in used in this example.

The TCM connection can be nested (B1-B2 is nested in A1-A2) or cascaded (B1-B2 and B3-B4).

### 3. Structure of the MIB

The managed Optical Networking interface objects are arranged into the following groups of tables:

The optIfOTMn group handles the OTM information structure of an optical interface.

`optIfOTMnTable`

The optIfPerfMon group handles the current 15-minute and 24-hour interval elapsed time, as well as the number of 15-minute intervals for all layers.

`optIfPerfMonIntervalTable`

The optIfOTSn groups handle the configuration and performance monitoring information for OTS layers.

```
optIfOTSnConfigTable
optIfOTSnSinkCurrentTable
optIfOTSnSinkIntervalTable
optIfOTSnSinkCurDayTable
optIfOTSnSinkPrevDayTable
optIfOTSnSrcCurrentTable
optIfOTSnSrcIntervalTable
optIfOTSnSrcCurDayTable
optIfOTSnSrcPrevDayTable
```

The optIfOMSn groups handle the configuration and performance information for OMS layers.

```
optIfOMSnConfigTable
optIfOMSnSinkCurrentTable
optIfOMSnSinkIntervalTable
optIfOMSnSinkCurDayTable
optIfOMSnSinkPrevDayTable
optIfOMSnSrcCurrentTable
optIfOMSnSrcIntervalTable
optIfOMSnSrcCurDayTable
optIfOMSnSrcPrevDayTable
```

The optIfOChGroup groups handle the configuration and performance information for OChGroup layers.

```
optIfOChGroupConfigTable
optIfOChGroupSinkCurrentTable
optIfOChGroupSinkIntervalTable
optIfOChGroupSinkCurDayTable
optIfOChGroupSinkPrevDayTable
optIfOChGroupSrcCurrentTable
optIfOChGroupSrcIntervalTable
optIfOChGroupSrcCurDayTable
optIfOChGroupSrcPrevDayTable
```

The optIfOCh groups handle the configuration and performance monitoring information for OCh layers.

```
optIfOChConfigTable
optIfOChSinkCurrentTable
optIfOChSinkIntervalTable
optIfOChSinkCurDayTable
optIfOChSinkPrevDayTable
optIfOChSrcCurrentTable
optIfOChSrcIntervalTable
optIfOChSrcCurDayTable
optIfOChSrcPrevDayTable
```

The optIfOTUk groups handle configuration information for OTUk.

```
optIfOTUkConfigTable
optIfGCC0ConfigTable
```

The optIfODUk groups handle configuration information for ODUk.

```
optIfODUkConfigTable
optIfODUkTtpConfigTable
optIfODUkPositionSeqTable
optIfODUkNimConfigTable
optIfGCC12ConfigTable
```

The optIfODUkT groups handle configuration information for ODUkT.

```
optIfODUkTConfigTable
optIfODUkTNimConfigTable
```

This memo does not define MIB objects for optical system cross-connects. After a consensus is reached on definitions of the interface MIB objects for optical systems (resulting from resolution of discussions on the objects proposed in this memo), work can progress on the definitions of tables to represent cross-connects (e.g., OCh optical cross-connects and ODUk electrical cross-connects).

### 3.1. The optIfOTMn group

#### 3.1.1. optIfOTMnTable

This table contains the OTM structure information of an optical interface.

### 3.2. The optIfPerfMon group

#### 3.2.1. optIf Performance Monitoring Interval Table

This table applies to all performance monitoring on an NE. It records on a per-interface basis the elapsed time in the current 15-minute and 24-hour interval, as well as the total number of 15-minute intervals and the number of invalid 15-minute intervals.

### 3.3. The optIfOTSsn groups

#### 3.3.1. optIfOTSsn Configuration group

##### 3.3.1.1. optIfOTSsn Configuration Table

This table contains information on configuration of optIfOTSsn interfaces, in addition to the information on such interfaces contained in the ifTable.

##### 3.3.2. optIfOTSsn Pre-OTN PM group

###### 3.3.2.1. optIfOTSsn Source Current Table

This table contains information on current performance of optIfOTSsn interfaces contained in the ifTable.

###### 3.3.2.2. optIfOTSsn Source Interval Table

This table contains information on historic performance of optIfOTSsn interfaces contained in the ifTable.

###### 3.3.2.3. optIfOTSsn Source Current Day Table

This table contains a snapshot of information for the current 24-hour period for optIfOTSsn interfaces contained in the ifTable.

###### 3.3.2.4. optIfOTSsn Source Previous Day Table

This table contains a snapshot of information for the previous 24-hour period for optIfOTSsn interfaces contained in the ifTable.

###### 3.3.2.5. optIfOTSsn Sink Current Table

This table contains information on current performance of optIfOTSsn interfaces contained in the ifTable.

### 3.3.2.6. optIfOTSsn Sink Interval Table

This table contains information on historic performance of optIfOTSsn interfaces contained in the ifTable.

### 3.3.2.7. optIfOTSsn Sink Current Day Table

This table contains a snapshot of information for the current 24-hour period for optIfOTSsn interfaces contained in the ifTable.

### 3.3.2.8. optIfOTSsn Sink Previous Day Table

This table contains a snapshot of information for the previous 24-hour period for optIfOTSsn interfaces contained in the ifTable.

## 3.4. The optIfOMSn groups

### 3.4.1. optIfOMSn Configuration group

#### 3.4.1.1. optIfOMSn Configuration Table

This table contains information on configuration of optIfOMSn interfaces, in addition to the information on such interfaces contained in the ifTable.

#### 3.4.2. optIfOMSn Pre-OTN PM group

##### 3.4.2.1. optIfOMSn Source Current Table

This table contains information on current performance of optIfOMSn interfaces contained in the ifTable.

##### 3.4.2.2. optIfOMSn Source Interval Table

This table contains information on historic performance of optIfOMSn interfaces contained in the ifTable.

##### 3.4.2.3. optIfOMSn Source Current Day Table

This table contains a snapshot of information for the current 24-hour period for optIfOMSn interfaces contained in the ifTable.

##### 3.4.2.4. optIfOMSn Source Previous Day Table

This table contains a snapshot of information for the previous 24-hour period for optIfOMSn interfaces contained in the ifTable.

#### 3.4.2.5. optIfOMSn Sink Current Table

This table contains information on current performance of optIfOMSn interfaces contained in the ifTable.

#### 3.4.2.6. optIfOMSn Sink Interval Table

This table contains information on historic performance of optIfOMSn interfaces contained in the ifTable.

#### 3.4.2.7. optIfOMSn Sink Current Day Table

This table contains a snapshot of information for the current 24-hour period for optIfOMSn interfaces contained in the ifTable.

#### 3.4.2.8. optIfOMSn Sink Previous Day Table

This table contains a snapshot of information for the previous 24-hour period for optIfOMSn interfaces contained in the ifTable.

### 3.5. The optIfOChGroup groups

#### 3.5.1. optIfOChGroup Configuration group

##### 3.5.1.1. optIfOChGroup Configuration Table

This table contains information on configuration of optIfOChGroup interfaces, in addition to the information on such interfaces contained in the ifTable.

##### 3.5.2. optIfOChGroup Pre-OTN PM group

###### 3.5.2.1. optIfOChGroup Source Current Table

This table contains information on current performance of optIfOChGroup interfaces contained in the ifTable.

###### 3.5.2.2. optIfOChGroup Source Interval Table

This table contains information on historic performance of optIfOChGroup interfaces contained in the ifTable.

###### 3.5.2.3. optIfOChGroup Source Current Day Table

This table contains a snapshot of information for the current 24-hour period for optIfOChGroup interfaces contained in the ifTable.

#### 3.5.2.4. optIfOChGroup Source Previous Day Table

This table contains a snapshot of information for the previous 24-hour period for optIfOChGroup interfaces contained in the ifTable.

#### 3.5.2.5. optIfOChGroup Sink Current Table

This table contains information on current performance of optIfOChGroup interfaces contained in the ifTable.

#### 3.5.2.6. optIfOChGroup Sink Interval Table

This table contains information on historic performance of optIfOChGroup interfaces contained in the ifTable.

#### 3.5.2.7. optIfOChGroup Sink Current Day Table

This table contains a snapshot of information for the current 24-hour period for optIfOChGroup interfaces contained in the ifTable.

#### 3.5.2.8. optIfOChGroup Sink Previous Day Table

This table contains a snapshot of information for the previous 24-hour period for optIfOChGroup interfaces contained in the ifTable.

### 3.6. The optIfOCh groups

#### 3.6.1. optIfOCh Configuration group

##### 3.6.1.1. optIfOCh Configuration Table

This table contains information on configuration of optIfOCh interfaces, in addition to the information on such interfaces contained in the ifTable.

##### 3.6.2. optIfOCh Pre-OTN PM group

###### 3.6.2.1. optIfOCh Source Current Table

This table contains information on current performance of optIfOCh interfaces contained in the ifTable.

###### 3.6.2.2. optIfOCh Source Interval Table

This table contains information on historic performance of optIfOCh interfaces contained in the ifTable.

### 3.6.2.3. optIfOCh Source Current Day Table

This table contains a snapshot of information for the current 24-hour period for optIfOCh interfaces contained in the ifTable.

### 3.6.2.4. optIfOCh Source Previous Day Table

This table contains a snapshot of information for the previous 24-hour period for optIfOCh interfaces contained in the ifTable.

### 3.6.2.5. optIfOCh Sink Current Table

This table contains information on current performance of optIfOCh interfaces contained in the ifTable.

### 3.6.2.6. optIfOCh Sink Interval Table

This table contains information on historic performance of optIfOCh interfaces contained in the ifTable.

### 3.6.2.7. optIfOCh Sink Current Day Table

This table contains a snapshot of information for the current 24-hour period for optIfOCh interfaces contained in the ifTable.

### 3.6.2.8. optIfOCh Sink Previous Day Table

This table contains a snapshot of information for the previous 24-hour period for optIfOCh interfaces contained in the ifTable.

## 3.7. The optIfOTUk groups

### 3.7.1. optIfOTUk Configuration group

#### 3.7.1.1. optIfOTUk Configuration Table

This table contains information on configuration of optIfOTUk interfaces, in addition to the information on such interfaces contained in the ifTable.

### 3.7.2. optIfGCC0 Configuration group

#### 3.7.2.1. optIfGCC0 Configuration Table

This table contains information on configuration of the GCC0 communication channel.

### 3.8. The optIfODUk groups

#### 3.8.1. optIfODUk Configuration group

##### 3.8.1.1. optIfODUk Configuration Table

This table contains all the objects that are common to endpoints (called trail termination points or TTPs) and connection termination points (CTPs), and also includes a flag stating whether TTP functions are present.

#### 3.8.2. optIfODUKTtp Configuration group

##### 3.8.2.1. optIfODUKTtp Configuration Table

This table contains TTP-specific information on configuration of optIfODUk interfaces, in addition to the information on such interfaces contained in the ifTable.

#### 3.8.3. optIfODUk Position Seq group

##### 3.8.3.1. optIfODUk Position Seq Table

This table contains information on the position sequence of the TCM function and/or GCC12 access that have been created within the optIfODUk interfaces, in addition to the information on such interfaces contained in the ifTable.

#### 3.8.4. optIfODUk Nim Configuration group

##### 3.8.4.1. optIfODUk Nim Configuration Table

This table contains information on configuration of optIfODUk Non-intrusive monitoring.

#### 3.8.5. optIfGCC12 Configuration group

##### 3.8.5.1. optIfGCC12 Configuration Table

This table contains information on configuration of the GCC1 and GCC2 communication channels.

### 3.9. The optIfODUkT groups

#### 3.9.1. optIfODUkT Configuration group

##### 3.9.1.1. optIfODUkT Configuration Table

This table contains information on configuration of optIfODUkT interfaces, in addition to the information on such interfaces contained in the ifTable.

#### 3.9.2. optIfODUkT Nim Configuration group

##### 3.9.2.1. optIfODUkT Nim Configuration Table

This table contains information on configuration of optIfODUkT Non-intrusive monitoring.

DESCRIPTION

"The MIB module to describe pre-OTN and OTN interfaces.

Copyright (C) The Internet Society (2003). This version  
of this MIB module is part of RFC 3591; see the RFC  
itself for full legal notices."

REVISION "200308130000Z"

DESCRIPTION

"Initial version, published as RFC 3591."  
 ::= { transmission 133 }

-- textual conventions

OptIfActI ::= TEXTUAL-CONVENTION

STATUS current

DESCRIPTION

"The trace identifier (TI) accepted at the receiver."  
SYNTAX OCTET STRING (SIZE(64))

OptIfBitRateK ::= TEXTUAL-CONVENTION

STATUS current

DESCRIPTION

"Indicates the index 'k' that is used to  
represent a supported bit rate and the different  
versions of OP<sub>U</sub>k, ODU<sub>k</sub> and OTU<sub>k</sub>.  
Allowed values of k are defined in ITU-T G.709.  
Currently allowed values in G.709 are:

k=1 represents an approximate bit rate of 2.5 Gbit/s,  
k=2 represents an approximate bit rate of 10 Gbit/s,  
k=3 represents an approximate bit rate of 40 Gbit/s."

SYNTAX Integer32

OptIfDEGM ::= TEXTUAL-CONVENTION

STATUS current

DESCRIPTION

"Indicates the threshold level for declaring a Degraded Signal  
defect (dDEGM). A dDEGM shall be declared if OptIfDEGM  
consecutive bad PM Seconds are detected."

SYNTAX Unsigned32 (2..10)

```
OptIfDEGThr ::= TEXTUAL-CONVENTION
  STATUS current
  DESCRIPTION
    "Indicates the threshold level for declaring a performance
     monitoring (PM) Second to be bad. A PM Second is declared bad if
     the percentage of detected errored blocks in that second is
     greater than or equal to OptIfDEGThr."
  SYNTAX Unsigned32 (1..100)

optIfOTMnBitRates OBJECT-TYPE
```

```
SYNTAX BITS { bitRateK1(0), bitRateK2(1), bitRateK3(2) }
MAX-ACCESS read-only
STATUS current
DESCRIPTION
"This attribute is a bit map representing the bit
rate or set of bit rates supported on the interface.
The meaning of each bit position is as follows:
  bitRateK1(0) is set if the 2.5 Gbit/s rate is supported
  bitRateK2(1) is set if the 10 Gbit/s rate is supported
  bitRateK3(2) is set if the 40 Gbit/s rate is supported
Note that each bit position corresponds to one possible
value of the type OptIfBitRateK.
The default value of this attribute is system specific."
::= { optIfOTMnEntry 3 }
```

```
optIfOTMnInterfaceType OBJECT-TYPE
SYNTAX SnmpAdminString
MAX-ACCESS read-only
STATUS current
DESCRIPTION
"This object identifies the type of interface. The value of
this attribute will affect the behavior of the OTM with
respect to presence/absence of OTM Overhead Signal (OOS)
processing and TCM activation. For an IrDI interface,
there is no OOS processing and TCM activation is limited
to n levels as specified by a TCM level threshold.
```

This object contains two fields that are separated by whitespace. The possible values are:

```
  field 1: one of the 4-character ASCII strings
            'IrDI' or 'IaDI'
  field 2: free-form text consisting of printable
            UTF-8 encoded characters
```

Note that field 2 is optional. If it is not present then there is no requirement for trailing whitespace after field 1.

The default values are as follows:

```
  field 1: 'IaDI'
  field 2: an empty string."
```

```
::= { optIfOTMnEntry 4 }
```

```
optIfOTMnTcmMax OBJECT-TYPE
SYNTAX Unsigned32 (0..6)
MAX-ACCESS read-write
STATUS current
DESCRIPTION
```

"This object identifies the maximum number of TCM levels allowed for any Optical Channel contained in this OTM. A new TCM activation will be rejected if the requested level is greater than the threshold. If InterfaceType object specifies a type of 'IaDI' for this OTM, then this attribute is irrelevant.

Possible values: unsigned integers in the range from 0 to 6 inclusive.

Default value: 3."

 MAX-ACCESS not-accessible  
 STATUS current  
 DESCRIPTION  
 "Specifies the monitor point for the ODUk Path non-intrusive monitoring function. The value source(2) is not allowed if the corresponding instance of optIfODUkDirectionality has the value sink(1), and the value sink(1) is not allowed if the corresponding instance of optIfODUkDirectionality has the value source(2). Either the value sink(1) or source(2) is allowed if the corresponding instance of optIfODUkDirectionality has the value bidirectional(3)."

The value sink(1) means monitoring at the sink direction path signal of the ODUk CTP.

The value source(2) means monitoring at the source direction

path signal of the ODUk CTP. Monitoring the source direction of an ODUk CTP is necessary in those cases where the ODUk CTP is at an SNCP (Subnetwork Connection Protection) end (e.g., see Figure I.1.2/G.874.1). If one would like to get the performance of the protected connection, one cannot use the NIM function at both ODUk CTP sinks (before the matrix), instead one should monitor the signal at the source ODUk CTP after the matrix."

**GROUP optIfOMSnSourcePreOtnPMGroup****DESCRIPTION**

"This group is optional. It may be implemented by systems with the necessary instrumentation on interfaces of ifType opticalTransport(196) that support OMSn source functions (i.e., for which the corresponding instance of optIfOMSnDirectionality -- if implemented -- has the value source(2) or bidirectional(3))."

**GROUP optIfOMSnSourcePreOtnPMThresholdGroup****DESCRIPTION**

"This group is mandatory if and only if TCA notifications are implemented. If the objects of this group are instantiated then the implementation must also provide, in an enterprise MIB, suitable TCA notification definitions and notification control objects. Implementation of the optIfOMSnSourcePreOtnPMGroup is a prerequisite for implementing this group "

**GROUP optIfOChGroupSinkPreOtnPMGroup**

**DESCRIPTION**

"This group is optional. It may be implemented by systems with the necessary instrumentation on interfaces of ifType opticalChannelGroup(219) that support OChGroup sink functions (i.e., for which the corresponding instance of optIfOChGroupDirectionality -- if implemented -- has the value sink(1) or bidirectional(3))."

**GROUP optIfOChGroupSinkPreOtnPMThresholdGroup****DESCRIPTION**

"This group is mandatory if and only if TCA notifications are implemented. If the objects of this group are instantiated then the implementation must also provide, in an enterprise MIB, suitable TCA notification definitions and notification control objects. Implementation of the optIfOChGroupSinkPreOtnPMGroup is a prerequisite for implementing this group "

**GROUP optIfOChGroupSourcePreOtnPMGroup****DESCRIPTION**

"This group is optional. ## 5. Security Considerations

There are a number of management objects defined in this MIB module with a MAX-ACCESS clause of read-write and/or read-create. It is possible for writes to these objects to have disruptive effects on network operation that range from invalid performance data to traffic interruptions. Users of this MIB module must therefore be aware that support for SET operations in a non-secure environment without proper protection can have a negative effect on network operations. The most sensitive objects are the read-write and read-create objects listed in the optIfOtnConfigCompl compliance statement that control the maximum number of TCM levels allowed (optIfOTMnTcmMax), automatic power reduction (optIfOTSsnAprControl), transmitted trail trace (optIfOTSsnTraceIdentifierTransmitted, optIfOTUkTraceIdentifierTransmitted, optIfODUKTtpTraceIdentifierTransmitted, optIfODUKTTtraceIdentifierTransmitted), expected source/destination access point identifiers (optIfOTSsnSAPIExpected, optIfOTSsnSAPIExpected, optIfOTUkDAPIExpected, optIfOTUkDAPIExpected, optIfOTUkSAPIExpected,

optIfODUkTtpDAPIExpected, optIfODUkTtpSAPIExpected,  
optIfODUKNimDAPIExpected, optIfODUKNimSAPIExpected,  
optIfODUKTDAPIMode, optIfODUkTSAPIExpected,  
optIfODUKTNimDAPIExpected, optIfODUkTNimSAPIExpected), trace  
identifier mismatch detection mode (optIfOTSnTIMDetMode,  
optIfOTUkTIMDetMode, optIfODUkTtpTIMDetMode, optIfODUkNimTIMDetMode,  
optIfODUkTTIMDetMode, optIfODUkTNimTIMDetMode), trace identifier  
mismatch consequent action (optIfOTSnTIMActEnabled,  
optIfOTUkTIMActEnabled, optIfODUkTtpTIMActEnabled,  
optIfODUkNimTIMActEnabled, optIfODUkTTIMActEnabled,  
optIfODUkTNimTIMActEnabled), threshold level for declaring a PM  
Second to be bad (optIfOTUkDEGThr, optIfODUkTtpDEGThr,  
optIfODUkNimDEGThr, optIfODUkTDEGThr, optIfODUkTNimDEGThr), threshold  
level for declaring a Degraded Signal defect (optIfOTUkDEGM,  
optIfODUkTtpDEGM, optIfODUkNimDEGM, optIfODUkTDEGM,  
optIfODUkTNimDEGM), whether the sink/source adaptation function is  
activated (optIfOTUkSinkAdaptActive, optIfOTUkSourceAdaptActive),  
whether Forward Error Correction is supported  
(optIfOTUkSinkFECEnabled), the application transported by the GCC  
entities (optIfGCC0Application, optIfGCC12Application), creating and  
deleting a conceptual row of a config table (optIfGCC0RowStatus,  
optIfODUkNimRowStatus, optIfGCC12RowStatus, optIfODUkTRowStatus,  
optIfODUkTNimRowStatus), whether the selected GCC overhead bytes are  
passed through or modified (optIfGCC12GCCPassThrough), TCM mode  
(optIfODUkTSinkMode), and provisioning of the sink/source LOCK signal  
(optIfODUkTSinkLockSignalAdminState,  
optIfODUkTSourceLockSignalAdminState), as these may cause traffic  
interruptions if improperly set.

The readable objects in this MIB module (i.e., the objects with a MAX-ACCESS other than not-accessible) may be considered sensitive in some environments since, collectively, they provide information about the performance of interfaces in OTN equipment or networks and can reveal aspects of their configuration. In such environments it is important to control even GET and NOTIFY access to these objects and possibly to encrypt the values of these objects when sending them over the network via SNMP.

SNMP versions prior to SNMPv3 did not include adequate security. Even if the network itself is secure (for example by using IPSec), there is no control as to who on the secure network is allowed to access and GET/SET (read/change/create/delete) objects in this MIB module.

It is RECOMMENDED that implementers consider the security features provided by the SNMPv3 framework (see [RFC3410], section 8), including full support for the SNMPv3 cryptographic mechanisms (for authentication and privacy).

Further, deployment of SNMP versions prior to SNMPv3 is NOT RECOMMENDED. Instead, it is RECOMMENDED that SNMPv3 be deployed and cryptographic security be enabled. It is then a customer/operator responsibility to ensure that the SNMP entity giving access to an instance of this MIB module is properly configured to give access to the objects only to those principals (users) that have legitimate rights to indeed GET or SET (change/create/delete) them.

## 6. Acknowledgements

Nathan Kohn initiated the concept, then gathered and coordinated the team that led to the initial version of the MIB. Mark Stewart/Brian Teer wrote sections on use of interface tables, reviewed the MIB Object Definitions for SNMP SMIv2 compliance, and wrote the PM sections in working with G.7710/Y.1701. Anni Huynh wrote the initial MIB definitions for the OTN interface. Tom Rutt wrote the summary section on the Structure of the MIB. Rishi Grover contributed to the objects to monitor banded amplifiers. Kam Lam wrote the sections on Optical Networking Terminology and the OTN layers configuration parameters. He was the editor for the last several versions of this document.

Thanks to Maarten Vissers for providing insight into Optical Networking concepts. Thanks to Lakshmi Raman and Moshe Rozenblit for reviewing and commenting on a preliminary version of the document.

Special thanks to C. Mike Heard for providing a top notch doctor review and many helpful suggestions to improve the MIB.
